Supplementary Online Material

Contents

SOM 1a. List of specimens of extant mammals used in this work.

SOM 1b. R scripts used in the analysis.

References

SOM 2. Database with the mean by genera for each variable (including body mass) used to calculate the prediction equations. Measurements in millimeters and body mass in kilograms.

SOM 1a. List of specimens of extant mammals used in this work.

	Taxon	Catalogue number	Substrate preference
XENARTHRA			
Bradypodidae	<i>Bradypus</i> sp.	AMNH 42454; 42838; 74136; 74137; 97315; 133437; 135474; 209940; 211663; 261304	arboreal
Megalonychidae	<i>Choloepus</i> sp.	AMNH 16873; 35483; 70440; 90269; 139772; 139773; 209941; 265952	arboreal
Myrmecophagidae	<i>Myrmecophaga</i> sp.	AMNH 1020; 100068; 100139; FMNH 15966	ground-dwelling
Myrmecophagidae	<i>Tamandua</i> sp.	AMNH 23432; 23436; 23437; 23565; 23567; 96258; 211659; 21660	semi-arboreal
Cyclopidae	<i>Cyclopes</i> sp.	AMNH 4780; 167845; 171297; 204662; 213188; FMNH 61853	arboreal
Dasypodidae	<i>Priodontes</i> sp.	AMNH 130387; 208104; FMNH 25271; 72913	ground-dwelling
CARNIVORA			
Ailuridae	<i>Ailurus</i> sp.	AMNH 35433; 119474; 146682; 146778; 185346	arboreal
Felidae	<i>Panthera</i> sp.	AMNH 85396; 113743; 113744; 113748; 135846	ground-dwelling
Felidae	<i>Acynonyx</i> sp.	AMNH 36426; 119654; 119655; 119656; 119657	ground-dwelling
Mustelidae	<i>Gulo</i> sp.	AMNH 35054; 35081; 149692; 165766	ground-dwelling
Ursidae	<i>Ailuropoda</i> sp.	AMNH 87242; 89028; 110453; 110454; 147746	ground-dwelling
Viverridae	<i>Arctictis</i> sp.	AMNH 181; 22906; 35469; 80163; 119600	semi-arboreal
MARSUPIALIA			
Dasyuridae	<i>Sarcophilus</i> sp.	AMNH 65670; 65672; 65673; 70406; 150211	ground-dwelling
Thylacinidae	<i>Thylacinus</i> sp.	AMNH 35244; 35504; 35866; 42259	ground-dwelling
Phascolarctidae	<i>Phascolarctos</i> sp.	AMNH 65607; 65608; 65609; 65610; 107805	arboreal
Vombatidae	<i>Vombatus</i> sp.	AMNH 42997; 65619; 65622; 70209; 146850	ground-dwelling
PHOLIDOTA			
Manidae	<i>Manis gigantea</i>	AMNH 53847; 53851; 53857; 53858	ground-dwelling
Manidae	<i>Manis pentadactyla</i>	AMNH 60004; 60006; 60007; 172147; 184959	semi-arboreal
PRIMATES			
Cercopithecidae	<i>Papio</i> sp.	AMNH 80771; 80774; 120388; 216247; 216251	semi-arboreal
Hominidae	<i>Gorilla</i> sp.	AMNH 54089; 54090; 54091; 54092	semi-arboreal
Hylobatidae	<i>Hylobates</i> sp.	AMNH 90268; 102463; 106581; 106584	arboreal
Lemuridae	<i>Lemur</i> sp.	AMNH 22912; 35396; 150039; 170739; 170740	arboreal
RODENTIA			
Erethizontidae	<i>Coendou</i> sp.	AMNH 80045; 100097; 100119; 134073; 212611	arboreal
Hystricidae	<i>Hystrix</i> sp.	AMNH 51735; 87220; 87222; 119506	ground-dwelling
Sciuridae	<i>Marmota</i> sp.	AMNH 70338; 97386; 179934; 180314; 235648	ground-dwelling
TUBULIDENTATA			
Orycteropodidae	<i>Orycteropus</i> sp.	AMNH 51370; 51374; 51905; 51909; 65540	ground-dwelling

SOM 1b. R scripts used in the analysis

MASS and *car* packages were used

Regression equation

```
"equation" <- lm("body mass"~"variable 1"+"variable 2"+..., weights=pond,
  data="data")#obtaining the regression equation
"model equation"<-stepAIC("equation", direction='both', criterion='AIC'
  #obtaining a new equation by removing redundant variables using a
  stepwise procedure based on the Akaike Criterion.
```

Where “data” is a dataframe object that contains all of the information from the extant mammals database (e.g., taxon, body mass, measurements, etc.); “equation” is a list R object that stores the output of a multiple linear model regression using “body mass” as the dependant variable. “Variable 1”... represents the variables (see Fig. 2 and 3 in Toledo et al. 2014) of each element (scapula, humerus, etc.). “pond” is a column that contains the taxonomic weighting factor for each taxon. “model equation” is a list R object containing the output of the stepwise procedure.

RE calculation

```
pred<-mean(10^(as.vector(fitted("model equation")))) #obtaining the mean
fitted values and removing the log-transformation
obs<-mean(10^(as.vector("data"$"body mass"))) #obtaining the mean observed
values and removing the log-transformation
RE<-obs/pred #obtaining the Ratio Estimator (see Material and methods
  section in Toledo et al. 2014)
```

%PE calculation

```
PE<-mean(abs(((as.vector((residuals("model
  equation"))))))/((as.vector((fitted("model equation"))))*100))
#obtaining the Percent Prediction Error (adapting to R the Smith 1984
  formula)
```

QMLE calculation

```
ANOVA<-anova("model equation")#obtaining the sum of squares for each
  equation
ResMsqr<-ANOVA[3][( length(ANOVA[3][,1])),] #storing only the residual mean
  squares of the equation
QMLE<-exp(ResMsqr/2)#obtaining the Quasi Maximum Likelihood Estimator of
  Fergusson (1986)
```

SE calculation

```
SE<-sum(exp(residuals("model equation")))/length(residuals("model
  equation"))#obtaining the Smearing Estimator of Duan (1983)
```

Body mass prediction

```
"BM output"<-(as.vector(10^(predict("model equation",
  newdata=data.frame("variable 1"="data fossils"[,c("variable 1")],
  "variable 2"="data fossils"[,c("variable 2")]))))*RE
```

Where “BM output” is a vector R object containing the estimates for each fossil specimen; “model equation” (see above); “data fossils” is a data frame R object that contains measurements (“variable 1”...) from the fossil sloths database; “RE” is the Ratio Estimator (see above) used to restore dimensionality.

SOM 2. Mean values for each variable (including body mass) used to calculate the prediction equations. Measurements in millimeters and body mass in kilograms.

Part I. SL, Scapular Length - supraglenoid tubercle to dorso-posterior border of scapula at end of spine; SGL, Scapular Glenoid fossa Length - supraglenoid apophysis to ventral border of glenoid fossa; SGW, Scapular Glenoid fossa Width - maximum transverse width of glenoid fossa; TDH, Transverse Diameter of Humerus - at midshaft; HL, Humerus Length - between head and trochlea; APDH, Antero-Posterior Diameter of Humerus - at midshaft; HHL, Humerus Head Length; HDASW, Humerus Distal Articular Surface Width; HTVL, Humeral Trochlear Valley Length; HTD, Humeral Trochlea Depth.
