SOM 4. Description of character states

Upper Molars

Division of the Anterocone of the M1:

- Anterocone with shallow subdivision.
- Anterocone deeply subdivided. The furrow reaches the crown basis.

Anterior cingulum of the M1:

- There is not a platform or a cingulum in front of the anterocone.
- There is a small platform in front of the anterocone.
- There is a platform and a small cingulum ridge in front of the anterocone.

Symmetry of the Anterocone of the M1:

- The labial and lingual cusps have similar size.
- The labial cusp is larger than the lingual.
- The labial cusp is smaller than the lingual.

Anterolophule of the M1"

- The anterolophule connects to the middle of the two cones forming the anterocone.
- The anterolophule connects to the lingual cusp.

Labial Spur of the Anterolophule of the M1:

- Present: There is a (short, medium or long) labial spur.
- Incipient: There is an incipient labial spur.
- Absent: The labial spur of the anterolophule is absent.

Protolophule of the M1:

- Posterior: The protolophule is posterior to the protocone.
- Almost double: The protolophule is posterior almost double, form by the labial spur of the anterolophule or by the forward paracone spur.
- Double: The protolophule is double.

Protolophule of the M2

- Anterior: The protolophule points forward and it is connected to the anterolophule in front of the protocone.
- Anterior almost double: The anterior protolophule points forward and there is an incomplete posterior protolophule.
- Transverse: The protolophule is transverse and connected to the protocone.
- Transverse almost double: The protolophule is transverse and there is an incomplete posterior protolophule.
- The entoloph is connected to the protocone indirectly through paracone and protolophule.
- Double: There is a double protolophule.

Ectoloph (Paracone Spur) of the M1 and M2

- Absent: The ectolophe is absent.
- Short: The ectolophe is short.
- Long: The ectolophe is well-developed.

Mesoloph of the M1 and M2

- Long: The mesoloph reaches the labial mesocingulum or the labial border of the molar.
- Medium: The mesoloph exceed the half of the length of the mesosinus.
- Short: The mesoloph is as long as half of the length of the mesosinus or shorter.
- Absent: The mesoloph is absent.

Lingual mesocingulum of the M1 and M2

- The lingual mesocingulum could be present or not, but never connects the hypocone and the anterocone.
- There is a strong lingual mesocingulum that connects the hypocone and the anterocone and runs lingual to the protocone.

Connection of the Ectolophe with the Mesoloph of the M1 and M2

- The ectolophe is connected with the mesoloph.
- There is not a connection between the ectolophe and the mesoloph.
- There is a mesoloph but the ectolophe is absent.
- There is neither a mesoloph nor an ectolophe.

Metalophule of the M1

- The metalophule is connected to the posteroloph just behind the hypocone
- Posterior: The metalophule points backwards reducing the posterosinus.
- Posterior: The metalophule points backwards more oblique and disappear the posteroloph and the posterosinus (or is very small).

Metalophule of the M2

- Anterior: The metalophule points forward and it is connected to the entoloph in front of the hypocone.
- Transverse: The metalophule is transverse and connected to the hypocone.
- The metalophule points backwards and it is connected to the posteroloph, just behind the hypocone.
- The metalophule is more oblique reducing the posterosinus.
- Double: The metalophule is double.

Metalophule of the M3

- Absent.
- Connected to the neo-entoloph.
- Connected to the anterior arm of the hypocone.
- Connected to the neo-entoloph (or to the entoloph) and to the protolophule.
- Connected to the anterior arm of the hypocone and the protolophule.
- Connected to the posterior arm of the protocone.

Lower Molars

Anteroconid of the m1

- The anteroconid is simple.

Labial Spur of the Anterolophid of the m1

- The labial spur is absent.
- There is an incipient labial spur.
- There is a short (or large) labial spur.

Metalolphulid of the m1

- The anterior metalolphulid points forward.
- The anterior metalolphulid points forward and there is an incomplete posterior metalolphulid.
- The metalolphulid is double.

Mesolophid of the m1 and m2

- Medium: The mesolophid exceed the half of the length of the mesosinusid.
- Short: The length of the mesolophid is half of the length of the mesosinusid or shorter.
- Absent: The mesolophid is absent.

Mesolophid of the m3

- Absent: The mesolophid is absent.
- Incipient: The mesolophid is incipient.
- Present: The mesolophid is well developed.

Ectomesolophid of the m1

- Absent: The ectomesolophid is absent.
- Present: The ectomesolophid is well developed.

Lingual Anterolophid of the m2

- Well-developed: The anterolophid reaches the antero-lingual corner of the metaconid.
- Short: The anterolophid does not reach the antero-lingual corner of the metaconid.
- Absent: The lingual anterolophid is absent.
