SUPPLEMENTARY ONLINE MATERIAL FOR

A phylogenetic analysis of the Cyathaspididae

David K. Elliott, Linda S. Lassiter, and Alain Blieck

Published in *Acta Palaeontologica Polonica* 2021 66 (3): 631-640.

<https://doi.org/10.4202/app.00811.2020>

Supplementary Online Material

SOM 1. Cyathaspididae character and transition state list with references.

SOM 2. Cyathaspididae data matrix of the 29 taxa and 35 characters used to produce the two most parsimonious trees of Figure 3 (Elliott et al. 2021).

SOM 3. Cyathaspididae 30t 35c to be run in PAUP*.

SOM 4. Cyathaspididae 30t 35c scripted to be run in TNT.

The supplementary data files are also available on dryad.org associated with this article.

SOM 1. Cyathaspidae character and transition state list

Dorsal plate

1. Maxillary brim ornament: (0) narrow with ridges parallel to the anterior margin; (1) broad with ridges parallel to the anterior margin; (2) ridges oriented antero-posteriorly; (3) narrow and unornamented. The rostral margin is folded ventrally to form this structure. It is present in some form in all cyathaspids in which this area has been prepared and exposed. Adapted from Lundgren and Blom (2013) Ch. 9.
2. Median rostral lobe or process: (0) present; (1) absent. A posteriorly directed ventral process of the rostrum. Conspicuous in *Torpedaspis elongata* (Broad and Dineley 1973); absent in *Ptomaspis* (Denison 1964) and the Boothiaspidinae (Elliott 2016). Adapted from Lundgren and Blom (2013) Ch. 10.
3. Preorbital process: (0) present and strongly developed; (1) present and weakly developed; (2) fused with sub orbital plate. Ventrally directed process of the dorsal shield anterior to the eye. Strongly developed in *Vernonaspis*, (Denison 1964); fused to the suborbital plate to form an enclosed orbit in *Alainaspis platyrhina* (Elliott and Dineley 1985). Adapted from Lundgren and Blom (2013) Ch. 11.
4. Lateral margin of dorsal plate constricted in front of orbits: (0) absent; (1) present. This feature is characteristic of *Poraspis* (Denison 1964).

5. Preorbital suture: (0) absent; (1) present. A notch in the ventral edge of the preorbital process present in *Alainaspis* and *Boothiaspis* (Broad 1973; Elliott and Dineley 1985).

Adapted from Randle and Sansom (2017) Ch. 46.

6. Anterior margin of the rostrum: (0) bluntly rounded; (1) tapering; (2) rounded; (3) rounded with medial lobe. Adapted from Pernègre and Goujet (2007) Ch. 35; Pernègre and Elliott (2008) Ch. 30.

7. Rostral ridge pattern: (0) transverse; (1) radiating; (2) longitudinal; (3) irregular whorls. Superficial dentine ridges are usually arranged in regular transverse or radiating patterns on the rostrum but in *Faberaspis* (Elliott et al. 2018), *Homalaspidella* (Denison 1964) and *Phyllonaspis* (Elliott 2016) the ridges are longitudinal. In *Torpedaspis* (Broad and Dineley 1973) the pattern consists of irregular whorls. Adapted from Lundgren and Blom (2013) Chs. 51, 52.

8. Postrostral field: (0) present; (1) absent. The anterior part of the central epitegum may show ornamentation differing in orientation from the main part of the epitegum in a triangular area delimited by the supraorbital sensory canals. Present in *Archegonaspis*, *Asketaspis*, *Ptomaspis* and *Tolypelepis*. Adapted from Lundgren and Blom (2013) Ch. 48.

9. Pineal macula: (0) present; (1) pineal area indistinct or indicated by short concentric ridges; (2) absent. The macula is a distinct, relatively large denticle situated above the pineal organ. It is well developed in *Anglaspis*, indistinct in *Americaspis* and absent in *Pionaspis*.

10. Rostral epitegum: (0) present; (1) absent. Not present in Americaspidinae, Boothiaspidinae and Poraspidae. Adapted from Lundgren and Blom (2013) Ch. 24.

11. Lateral epitega: (0) divided into orbital and posterolateral areas; (1) present; (2) absent.

The lateral epitega are divided in orbital and posterolateral areas in *Asketaspis* and

Tolypelepis.

12. Interepital band of tubercles: (0) present; (1) absent. Contingent upon the presence of rostral epitegum (Ch. 10) and lateral epitega (Ch. 11). Adapted from Lundgren and Blom (2013) Ch. 38.

13. Lateral epitega reach the posterior margin of the dorsal plate: (0) present and do reach border; (1) present and do not reach the border. Contingent upon the presence of lateral epitega (Character 11). The Anglaspidae and *Asketaspis* have lateral epitega that reach the posterior margin.

14. Lateral brim: (0) absent; (1) present. A narrow, laterally extended lamina present in *Liliaspis*, *Paraliliaspis* and the Boothiaspidinae. Adapted from Lundgren and Blom (2013) Ch. 14.

15. Lateral margins of the dorsal plate: (0) convex and widest posteriorly; (1) convex and widest medially; (2) concave medially. Most cyathaspids are convex but *Faberaspis*, *Homalaspidella* and *Poraspis* are concave medially.

16. Posterior dorsal median crest: (0) absent; (1) present. Present in *Alainaspis*, *Anglaspis*, *Cyathaspis* and *Paraliliaspis* but absent in most cyathaspids. Adapted from Lundgren and Blom (2013) Ch. 19.

17. Dorsal and ventral plates in contact behind the branchial opening: (0) absent; (1) present.

In *Anglaspis*, *Nahanniaspis* and *Poraspis* the branchial opening is situated posteriorly with no contact between the median dorsal and ventral plates.

18. Dorsal plate postbranchial lobe: (0) absent; (1) present and weakly developed; (2) present and strongly developed. The downward postbranchial flexure of the margin of the dorsal plate. Adapted from Lundgren and Blom (2013) Ch. 20.

19. Posterior margin of the dorsal plate: (0) irregular (scale-like units); (1) transverse; (2) triangular; (3) median lobe with lateral concavities; (4) convex. Adapted from Pernègre and Goujet (2007) Ch. 27; Pernègre and Elliott (2008) Ch. 35.

20. Dorsal plate ornamentation: (0) scale-like units; (1) ridges anteriorly breaking down to scale-like units posteriorly; (2) elongated ridges. Most cyathaspids exhibit elongated ridges. There are some distinctions posteriorly in *Archegonaspis*. Adapted from Lundgren and Blom (2013) Chs. 39, 40; Randle and Sansom (2017) Chs. 75, 76.

21. In the central part of the dorsal plate dentine ridges with higher, coarser ridges separated by finer ones: (0) present with short ridge segments; (1) present with continuous ridge segments; (2) absent. Most cyathaspids lack this character. Present in *Cyathaspis* and some archegonaspids. Adapted from Lundgren and Blom (2013) Ch. 46.

22. Needle-shaped ridges (rounded at one end, pointed at the other): (0) present; (1) absent. Distinctive in *Asketaspis*, *Ptomaspis* and *Tolypelepis*. Adapted from Lundgren and Blom (2013) Ch. 55.

23. Dentine ridge crests: (0) convex; (1) angular; (2) flat. Adapted from Randle and Sansom (2017) Ch. 47.

24. Pattern of dentine ridges in the central part of the dorsal plate: (0) longitudinal and short; (1) longitudinal and long; (2) elliptical or concentric; (3) transverse; (4) irregular whorls.

Boothiaspis has transverse ridges in the central part and *Torpedaspis* has irregular whorls in the same area.

25. Ridges form whorls on the lateral margins of the dorsal plate: (0) absent; (1) present. This feature is characteristic of the Boothiaspidinae (Elliott 2016).

Branchial area

26. Position of the branchial opening: (0) at postero-lateral corner of the shield and posteriorly directed; (1) postero-lateral; (2) medial lateral. State 0 is only present in the outgroup, *Athenaegis*. Adapted from Lundgren and Blom (2013) Chs. 29, 30, 31.

27. Branchial plate with a posterior dorsal lobe: (0) absent; (1) present. Contingent upon having a branchial plate, which is true for all cyathaspids but not for the outgroup. Adapted from Lundgren and Blom (2013) Ch. 28.

28. Row of scales between the branchial plate and the ventral plate: (0) absent; (1) present. Present in *Nahanniaspis* and *Dinaspidella* (Dineley and Loeffler 1976). Adapted from Lundgren and Blom (2013) Ch. 4.

Scales and sensory canal system

29. Trunk scales: (0) numerous rows of similar size and shape; (1) dorsolateral and ventrolateral scales of similar size and shape; (2) dorsolateral scales larger than ventrolateral scales. Adapted from Lundgren and Blom (2013) Ch. 32; Randle and Sansom (2017) Ch. 63.

30. Pattern of laterosensory canals: (0) short interrupted lengths; (1) continuous network; (2) anastomosing system. Although *Dikenaspis* and *Irregulareaspis* have an anastomosing system *Dikenaspis* is not considered to be part of the Irregulareaspidinae (Dineley and Loeffler 1976). Adapted from Lundgren and Blom (2013) Ch. 61; Randle and Sansom (2017) Ch. 84.

31. Connection between supraorbital canal and infraorbital canal (transverse supraorbital commissure): (0) absent; (1) present. Adapted from Lundgren and Blom (2013) Ch. 59; Randle and Sansom (2017) Ch. 85.

32. Dorsal transverse commissures: (0) three; (1) four.

Ventral plate

33. Lateral margins of the ventral plate: (0) slightly convex; (1) straight; (2) strongly convex. Straight margins seen in *Boothiaspis*, *Dinaspidella* and *Nahanniaspis*. *Phyllonaspis* has strongly convex lateral margins (Elliott 2016).

34. Ridge pattern of the ventral plate: (0) longitudinal; (1) longitudinal becoming transverse anteriorly; (2) elliptical; (3) irregular whorls. Elliptical ridge patterns evident in *Cyathaspis*, *Capitaspis* and *Dikenaspis* (Dineley and Loeffler 1976). Only *Irregulareaspis* has irregular whorls on the ventral plate.

35. Posterior margin of the ventral plate: (0) transverse; (1) blunt median point; (2) triangular.

All Boothiaspidinae, Irregularaspidae and Poraspidae show a blunt median point.
