

Polychaete jaw apparatuses and scolecodonts from the Upper Devonian of Poland

Hubert Szaniawski and Ryszard M. Wrona

Acta Palaeontologica Polonica 18 (3), 1973: 223-267

From Frasnian strata pierced by the Opole Lubelskie borehole in the south-eastern Poland, 10 polychaete jaw apparatuses are described. For these apparatuses, 7 new species and 3 new genera are proposed: *Multiprion opolensis* n.gen., n.sp., *Mochtyella kielanae* n.sp., *Xaniopriion walliseri* n.sp., *Processopriion longiprocessus* n.gen., n.sp., *Polychaetaspis hindei* n.sp., *Kielanopriion elli* n.sp., and *Hindeopriion basalaris* n.gen., n.sp. Moreover, 4 new species and 3 new genera of isolated polychaete jaws are described: *Langeites lublinensis* n.sp., *Trianguligenys* n.gen., *Uncinogenys uncinatus* n.gen., n.sp., *Serratula minutidentata* n.gen., n.sp., and *Serratula longidentata* n.sp. The problems of taxonomy of fossil polychaetes are discussed and necessity of further application of two independent systematics, one for

scolecodonts and other for jaw apparatuses, is emphasized.
