

New specimens of the multituberculate mammal *Uzbekbaatar* from the Late Cretaceous of Uzbekistan

Alexander O. Averianov and J. David Archibald

Acta Palaeontologica Polonica 51 (2), 2006: 377-380

Uzbekbaatar Kielan–Jaworowska and Nesson, 1992 is among the rarest mammals and the only multituberculate in the diverse, eutherian dominated Bissekty (Turonian) and Aitym (?Coniacian) local faunas, Kyzylkum Desert, Uzbekistan.

New material from the Bissekty local fauna, suggests that only one multituberculate species, *Uzbekbaatar kizylkumensis* Kielan–Jaworowska and Nesson, 1992 is present in the Bissekty fauna.

A newly collected p4 is better preserved than the holotype and demonstrates presence of the posterolabial cusp in the p4 of *Uzbekbaatar*. New material of *Uzbekbaatar* is consistent with placement of this taxon within the basal cimolodontan “*Paracimexomys* group.”
