

## Novel pneumatic features in the ribs of the sauropod dinosaur *Brachiosaurus altithorax*

Michael P. Taylor and Mathew J. Wedel

*Acta Palaeontologica Polonica* 68 (4), 2023: 709-718 doi:10.4202/app.01105.2023

Pneumatic dorsal ribs are known for many sauropods, but to date costal pneumaticity has received relatively little attention. In particular, the pneumatic ribs of the holotype specimen of *Brachiosaurus altithorax* have been largely overlooked, although they present a unique configuration of pneumatic features. One rib, with a pneumatic foramen some distance down the shaft, was briefly described and illustrated in the early 20th century by Elmer S. Riggs. A second rib with a pneumatic foramen in the tuberculum of the rib has not previously been described or illustrated. This previously undescribed foramen is similar in location to those in some dorsal ribs of *Brontosaurus excelsus* and *Giraffatitan brancai*, but differs from them in both size and shape. The contrasting sites of costal pneumaticity in the holotype individual of *Brachiosaurus altithorax* emphasize the generally opportunistic mode of postcranial pneumatization, in both sauropods and other ornithomirans, but conform to models of pneumatization following vascularization.

**Key words:** Sauropoda, Dinosauria, Brachiosauridae, pneumaticity, costal pneumaticity.
